

Auxiliary systems for wind power generation

Overview

Do offshore wind turbines need auxiliary power?

Most offshore wind turbines are installed with an on-board diesel generator to provide auxiliary power. One of the basic needs of a wind turbine is the provision of auxiliary power, especially before it is connected to the onshore electricity grid. Power is required for cranes mounted on foundations.

Do wind farms need auxiliary power?

A robust source of auxiliary power is also required to manage risk in operational wind farms. Wind turbine warranties can be voided if the turbine is without power for more than a few days, radically altering the risk profile and hence insurance requirements of the wind farm.

What are the basic needs of a wind turbine?

One of the basic needs of a wind turbine is the provision of auxiliary power, especially before it is connected to the onshore electricity grid. Power is required for cranes mounted on foundations. Once the wind turbine is installed, further power is needed to provide lighting, heating, clean air systems and to turn over sensitive equipment.

Can a wind turbine be used for animal grazing?

In addition, the land below each turbine can still be used for animal grazing or farming. Disadvantages of using wind turbines include the need for more land space to support a wind farm and the difficulty in having a location with enough wind to produce maximum efficiency and power (Figure 3).

How much electricity does an Acua wind farm supply?

Therefore, on an annual basis, the ACUA wind farm can supply more than 60 percent of the electricity required by the plant. The remaining electricity can be bought from the local power grid when windmills are not at peak capacity (during calm or gusty weather).

Can offshore wind farms be built without power?

Offshore wind farms are being built in ever deeper, harsher waters. Diesel generators are used to provide power when these are without grid connection – but access for refuelling in this challenging environment is increasingly uncertain. Turbines without power are not an option.
