

Japan PV inverter grid-connected price

Overview

Is Japan's high cost structure for solar PV ingrained?

Additionally, generation costs under a leader value scenario has approached a level not far off the 2018 global weighted average unit cost for solar PV of 8.5 US cents/kWh (IRENA, 2019). Given these factors, we believe that Japan's high cost structure for solar PV is not ingrained, and can be resolved.

How much does solar PV cost in Japan?

Although the cost of solar PV in Japan is declining, it remains far higher than global standards. The average solar PV cost in 2018 calculated using the latest data from the Calculation Committee for Procurement Price, etc. was 17.6 yen/kWh (16 US cents/kWh calculated at 1 USD=110 JPY) 2.

What is the PV power systems market?

The PV power systems market is defined as the market of all nationally installed (terrestrial) PV applications with a PV capacity of 40 W or more. A PV system consists of modules, inverters, batteries and all installation and control components for modules, inverters and batteries.

Can PV electricity be traded on the power market in Japan?

As mentioned above, as of 2022 in Japan, there were no cases of direct power trading of PV electricity on the power market without depending on incentives or subsidies. There are no governmental support measures. However, there were cases of virtual PPA (VPPA).

Can solar PV power plants be connected to the grid?

In other words, when connecting solar PV power plants to the grid, rather than outsourcing the work to a general power transmission contractor the business operator performs the work to connect the system to the connection point. Data from this study also indicates that this has the potential to reduce grid connection costs significantly.

How long will a solar PV power plant operate in Japan?

In the case of a 30-year operating period, a solar PV power plant which commenced operation in 2030 will operate until 2059. At this time, it is likely that the scale of solar PV generation in Japan will be significantly larger. In this situation, it is possible that a frequent oversupply of electricity will occur during daytime hours.
