

Micro-generation power station

Overview

Microgeneration is the small-scale production of heat or electric power from a "low carbon source," as an alternative or supplement to traditional centralized grid-connected power. Microgeneration technologies include small-scale wind turbines, micro hydro, solar PV systems, microbial fuel cells, ground.

In the United States, Microgeneration had its roots in the and the which prompted innovation. On June 20, 1979, 32 solar panels were installed at the .

Microgeneration can be integrated as part of a house and is typically complemented with other technologies such as domestic food production systems (.
