

North American container energy storage project requirements

Overview

What is a containerized battery energy storage system?

Containerized Battery Energy Storage Systems (BESS) are essentially large batteries housed within storage containers. These systems are designed to store energy from renewable sources or the grid and release it when required. This setup offers a modular and scalable solution to energy storage.

Are energy storage containers a viable alternative to traditional energy solutions?

These energy storage containers often lower capital costs and operational expenses, making them a viable economic alternative to traditional energy solutions. The modular nature of containerized systems often results in lower installation and maintenance costs compared to traditional setups.

Why should you choose a containerized energy system?

The modular nature of containerized systems often results in lower installation and maintenance costs compared to traditional setups. And when you can store up energy when it's inexpensive and then release it when energy prices are high, you can easily reduce energy costs.

What's new in energy storage safety?

Since the publication of the first Energy Storage Safety Strategic Plan in 2014, there have been introductions of new technologies, new use cases, and new codes, standards, regulations, and testing methods. Additionally, failures in deployed energy storage systems (ESS) have led to new emergency response best practices.

How big is battery energy storage in North America?

Over the last few years, battery energy storage has grown significantly across North America. In 2014, utility-scale battery storage capacity in North America was approximately 214 MWs. By 2019, this amount increased to 899 MWs.

This growth is expected to continue with utility scale storage levels reaching 3,500 MWs by 2023.

What is a typical energy storage deployment?

A typical energy storage deployment will consist of multiple project phases, including (1) planning (project initiation, development, and design activities), (2) procurement, (3) construction, (4) acceptance testing (i.e., commissioning), (5) operations and maintenance, and (6) decommissioning.
