

Outdoor power supply charged 90

Overview

What wattage does a cheap power supply have?

So a cheap power supply may have like 10 Watts on the 3.3V, 25 Watts on the 5V, and 165W on the 12V and call that 200 Watts (10 + 25 + 165) Some cheap brands even list wattage with "peak" or "max" in the wattage phrasing indicating that they aren't meant to hold that power for more than a few ms.

How long can a power supply last?

Power supplies age. As such they can lose as much as 20% of their capacity over time. Sometimes more. Running your supply close to it's limit 24/7 isn't good for longevity as it generates excess heat to run it near it's limit. The general rule of thumb is don't run it more than 80% capacity long term.

How long should a power supply run at full load?

A good power supply review will always do a torture test, where they run it at full power load for 5->10 minutes, and run it at 80% power load for a good 8->24hours. I'm not sure but does this look like your power supply?

I would say you are really pushing your limits. You could try it.

Outdoor power supply charged 90

Is it safe to charge power station to 100 when it is discharged to ...

It is safe, but would prolong your battery life if charged less. I would have them charged 60-90%. Not below 50%. This hold for lithium batteries. If you have lead batteries, then keep them at ...
