

Temporary capacity expansion plan for power supply and energy storage vehicles

Overview

What is generating and storage capacity planning in European power system?

Literature studies the expansion and the operation perspectives of European power system, a multi-stage investment model is established for generating and storage capacity planning. In , a bi-level generation expansion planning approach is proposed, in which the renewable energy market is integrated into power system operations.

What is a capacity expansion planning method?

A new capacity expansion planning method is presented considering short-term multistage operation process. Multistage operation process helps to evaluate more accurate operational cost and more reasonable planning decisions. The designed acceleration algorithm greatly improves the efficiency of solving planning problems.

How to solve a capacity expansion planning problem?

Solution method for capacity expansion planning For such a capacity expansion planning problem, there are two main difficulties in solving the optimal planning decisions. Firstly, an efficient solving approach shall be proposed for long-term hourly robust TCUC and ED problems guaranteeing computational efficiency.

What is a bi-level generation expansion planning approach?

In , a bi-level generation expansion planning approach is proposed, in which the renewable energy market is integrated into power system operations. In , a novel data-driven scenario generation framework is proposed for the transmission expansion planning problem to generate unseen but important load and wind power scenarios.

How does es expansion capacity affect planning costs?

Influence of ES expansion capacity on planning costs. As shown in Fig. 7, the

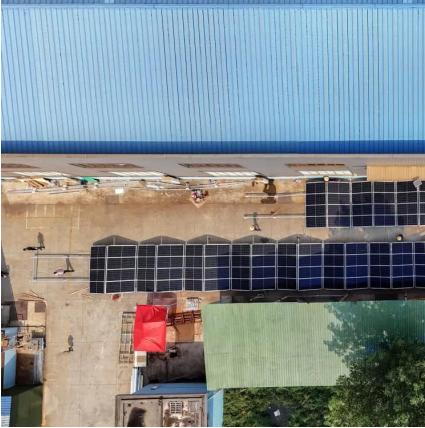

operational cost decreases with the increase of expansion capacity since more planning capacity means more available integration of renewable energy. For the total investment cost, it decreases first and increases with the increasing of expansion capacity.

Is es expansion capacity an uneconomical choice?

In conclusion, in this power system, only expanding ES capacity is an uneconomical choice. It is exactly based on the influence of wind power and ES expansion capacity on planning costs, the gradient descent method is nested into GA to accelerate the convergence, and the GANGD approach is proposed in this paper.
