

The network communication base station has no power

Overview

Does communication volume affect the power consumption of a base station?

For the power consumption of the base station, this paper focuses on the effect of communication volume on the power consumption of the base station, while the distance between the user and the base station is regarded as a fixed value, which is an assumption that differs from the actual situation.

Why do base stations have a small backup energy storage time?

Base stations' backup energy storage time is often related to the reliability of power supply between power grids. For areas with high power supply reliability, the backup energy storage time of base stations can be set smaller.

Do mobile operators support the use of base station energy storage?

The premise of the research conducted in this article is that mobile operators support the use of base station energy storage to participate in emergency power supply.

How is energy sharing between base stations achieved?

Energy sharing between base stations is achieved through resistive power lines. However, the error of the energy storage capacity model obtained by linear fitting is large because the variation of the communication volume in different regions does not have a linear law, and there are spatial and temporal differences.

Can base station energy storage participate in emergency power supply?

Based on the established energy storage capacity model, this paper establishes a strategy for using base station energy storage to participate in emergency power supply in distribution network fault areas.

Does a base station energy storage model improve the utilization rate?

Where traffic is high, less base station energy storage capacity is available. Compared with the fixed backup time, the base station energy storage model proposed in this article not only improves the utilization rate of base station energy storage, but also reduces the power loss load and power loss cost in the distribution network fault area.
